LOT PAGER ��� 08-SESSION-PROTOCOL

LOT® PAGER — Session Compression Protocol

“Compress the information in each session” is implemented at three levels.

1. Documentation sessions (how this project is recorded)

Each working session ends with one Markdown report in `docs/hardware/lot-pager/sessions/` named `HW-SR-YYYYMMDD-NN.md`: - ≤ 1 page TL;DR (decisions, deltas, open questions) first; - details after; nothing duplicated from the numbered spec docs — link to them; - ledger line appended to `docs/assembly/LOT-LEDGER.md`. Reports are pushed to the working branch each session (per brief). PDFs regenerated with `build.sh`.

2. Device payloads

Notification: CBOR (not JSON) is optional later; v0 uses JSON ≤ 240 B.

3. Telemetry

Batch 5-minute window; delta-encode readings; heatshrink/zstd-lite on the batch; fallback gzip. Expected 2–6 KB/day/device.

4. Camera

JPEG q=70, ≤640×480, ~25–40 KB.

5. Session memory on the server

Device sessions roll up into one Memory-engine summary per day (existing Memory Engine), keeping only the notification outcome (acked / ignored / copied) and aggregated sensor stats.
