

LOT Computer — Setup & Operation Manual

LOT Systems Corporation · brand.lot-systems.com

Inventor: Vadik Marmeladov · LOT® / COSMO® CIA

Manual version 0.1 · 2026-09-12 · Pre-production draft (v0.1 hardware track)

What it is

LOT Computer is a small stainless-steel notification device that sits on your desk. It shows one message at a time from your LOT account — things like "Coffee time!" — and has a single button, **Copy**, that saves the moment to your Log on lot-systems.com.

One side is polished stainless steel. The other holds a camera, a round screen, and the Copy button. It charges wirelessly.

This manual covers first setup, daily use, and care. It describes the planned v1.0 device — see LOT-COMPUTER-HARDWARE-SPEC.md if you are building or sourcing the unit rather than using one.

In the box (planned)

- LOT Computer unit
 - Wireless charging pad (Qi)
 - USB-C cable (charging pad power + firmware recovery)
 - Quick-start card with a pairing QR code
-

First setup

1 Place LOT Computer on the charging pad. The screen lights up with the

LOT wordmark once there is enough charge to boot.

- 1 The screen shows **PAIR ME** and a 6-digit code.
- 2 On lot-systems.com, sign in and open **Settings** → **Devices** → **Add Device**.
- 3 Enter the 6-digit code shown on the unit.
- 4 The screen changes to your account's idle view. Setup is done.

If the unit does not show a pairing code, hold the Copy button for 5 seconds to reset it into pairing mode.

Daily use

Notifications. When lot-systems.com has something short and timely to tell you, it appears on the screen — for example "Coffee time!" — and stays for up to 10 minutes or until you press Copy, whichever comes first.

The Copy button. Press it once to:

- Save the message currently on screen to your Log, with a timestamp.
- Take a quick photo through the built-in camera, attached to that Log

entry (best effort — if the shot fails, the text still saves).

- Flash the screen border green to confirm — this happens even if your

WiFi is briefly down; the save is queued and sent as soon as you're back online.

Weather. A small temperature and air-quality glyph sits at the edge of the idle screen, read from the unit's onboard sensor. This also feeds a summary into your Log roughly every 15 minutes.

Charging

Set the unit on its pad any time; it charges wirelessly through a window in the underside designed for that purpose (the polished top face is not the charging side). A full charge from empty takes a few hours; the unit is designed to live on the pad continuously rather than run untethered for long stretches — treat it like a desk object that's always docked, not a device you carry around.

Care

- Wipe the polished stainless face with a soft cloth; avoid abrasive cleaners, which will dull the finish.
- Keep the camera lens window clear of dust for reliable Copy-button

photos.

- The unit is a desk object, not a rated water-resistant device in v1 —

keep it away from spills.

Troubleshooting

Symptom	What to do
Blank screen on the pad	Check the pad is powered (USB-C into a wall adapter, not just a laptop port in sleep).
No pairing code appears	Hold Copy for 5 seconds to force pairing mode.
Copy press doesn't reach the Log	Check WiFi at the pairing location; presses queue locally and retry automatically once reconnected.
Notifications stop arriving	Re-check pairing under Settings → Devices; a revoked or expired device token will stop delivery silently by design (no false green light).

What this device is not

- It is not a general-purpose display — it shows one short line at a time.
 - It does not run apps or a browser.
 - It is not the LOT Quantum Cube (CUBIQ™), which moves; this device is stationary.
 - It is not the COSMO® companion robot; it has no locomotion or voice.
-

This manual describes a pre-production design (v0.1 hardware track, 2026-09-12). Specifications — dimensions, battery life, exact sensor part numbers — may change before the 100-unit production run. See docs/technical/LOT-COMPUTER-HARDWARE-SPEC.md for the current engineering detail behind every claim in this manual.
